THE WAVE

carbon-zero interactive mesh

Arrival experience | shaded gardens over the entrance

N

Color-stimulated photosynthetic induction | The LSCs system also works as a light filter, that allows only a small parcel of the visible light spectrum to pass through, this can be used in many ways to stimulate photosynthesis by the use of specific wavelengths, different plants react differently to extended exposure to certain colors, which can enhance plants color, fruiting, and aroma.

Implantation | modules on top of the U-Hall with color zones

Plants absorption spectrum | color-stimulated photosynthetic induction
