The solar panels are inset into the supporting structure. The supporting structure is joint steel which there is space on both sides of the structure. The solar panels overlaid on the structure can make best use of the abundant sunshine in the S1 Hills. They can efficiently convert the heat from the sun into electric all day long.

The land art generator can capture natural power from the sunshine and the wind by the solar panel and the air fan overlaid on the surface of the generator. The clean electricity generated by the generator will be delivered to the city electricity net.

The extra electricity will serve the nearby communities in order to decrease the use of unclean power.

Using the clean power from the land art generator will not only make people realise the importance of saving energy but also get used to the generator.

Energize the community life 3
