

Response to the Nature

The ocean breeze sweeping off St Kilda beach glides past the aluminium turbine wings. Here the circulating air is captured by the spinning blades of the turbine and energy is created. Simultaneously, the light that fragments on the ocean is also captured and reflected by the turbines. Giving a shimmer to the facade. This creates a language between the structure and surrounding landscape while providing a temporality to the design.

The turbine aluminium blades throw off light at different angles creating a natural light show.

The project build creates an atmosphere that can be found on the surface of the ocean. The diffused reflected light shimmering on the water and cool sea breezes are captured within the site.
