

Besides their performative functions, these Energy Domes work as cultural catalyzers. Thematic activities are programmed and public gatherings occupy these forest glades. Open air art festivals, energy awareness meetings and participatory workshops on health and ecology are celebrated periodically in these spaces.

These three forest glades are interconnected through an elevated trail. A runway that crosses the site amid the birch treetops offering unexpected views of the blooming life of the forest. This corridor extends its way south to bring people to the elevated viewpoint prairie, and it extends north to generate a pedestrian bridge over Jacka Blvd., connecting St. Kilda triangle to the Bay Trail and with the Catani Gardens ecological corridor.

This structure is used as well to generate an energy network between the different Energy Domes (balancing and compensating those producing less with those producing more) and to bring technical services (water and electricity) to different areas of the forest.
