

THE LIFE ARK

The device can sense tides and winds. Follow the pulsations of the earth and breathe.

IDEA

This design Dye Sensitized Solar Cell's image comes from my eco-bottle. In a sunny afternoon, I accidentally noticed it in the corner under the sun when I was sitting at my desk and planning to start my work. I was surprised to find that it was just an ark that carries life? It was a living organism carrying out the exchange of photosynthesis materials. I was surprised by my idea. Suddenly it felt that its symbolic significance had surpassed the money I had spent on it. The inspiration for this project comes from this. An "Ark" of life floating on the ocean. This reminded me of Australia surrounded by the sea. It is an image. When you sit on the local beach and look out into the distance, it floats there. It looks like there is a green wonderland overhead. It is calling you and guiding you. Then when the light is weak, you will find that it will flicker with the frequency of the waves. It is a life. It is a life that is suspended on the surface of the sea and can perform photosynthesis and experience the pulsating life of the Earth such as wind and waves. When you approach it. It is there. You can reach there by boat. Here is a 110m × 110m base platform. People can look into the coast and the sea here. People can also rise up to the garden through the elevator on the base. There are green plants cultivated. It can provide rest places for birds and other animals. People can also use this place as a rest and sightseeing place for some leisure activities. You can feel that it is no longer a power station, but an art installation, an ark symbolizing ecology and life and reflecting our thoughts on the life of the Earth. So there will be a new symbol in this city. It will also affect the city so that the city has a new image. The existence of this life image will also make people pay more attention to life, to the green, to the environment, to the ecology, and to the Earth.
