

The bridge connects the two site boundaries, allowing visitors to easily access nature from the St. Kilda area. With a structure of recycled steel, the bridge holds two grid-tied inverters which feed back into the community of Port Philips and one on-site battery storage which will power lighting in the St. Kilda Triangle and on the bridge. The holographic solar film blends in seamlessly with the site's surroundings, allowing patrons to catch glimpses of the ocean from behind the structure. Hand in Hand is a pleasing silhouette for all patrons to behold.

View from the bridge:
