

When the wind flow from the sea, our swinging home start to work. The spider plants "Chlorophytum Comosum" will start to breathe. It is when the effect of green house gases threaten our earth. Green surface of our planet will capture the gases and will make oxygen for breathing. The metal surfaces called "windbelt" start to vibrate and will help us in process of converting mechanical to electrical energy. when the red sphere of sun appear in blue horizon of the sea, our solar panels will catch the fall of light in the age of using renewable energies. Human which his activities caused recent problems for environment has an important role in our project. His joy of life could be a reliable source of renewable energy from transformation of mechanical to electrical form of energy. And here we want to combine the concept of humanity in context of landscape with its own pleasures with his own home
