

The energetic self-establishment and its technical implications
 The kinetic ailerons are made of light weight and resistant materials for easy movement. Their turning on their own axis in the rotation rings can produce energy with very gentle winds from about 22km/h, this through the installation of six (6) generators of 30KVA each one of them.

WHEELS ●

GENERATORS ●

RING ●

"The physichromia are a trop of light, apace where a series of plots interact to transform each other."

The wind pushes the polychrome ailerons of the ring, where one of the kinetic effects of the work can be appreciated. It will look like on the right side of the ring, the colors will begin to emerge with the movement, and how they disappear on the left side of the ring. When the speed increases the effect of kinetic physichromy is produced and it will be possible to appreciate how the different colors merge until they become white.
