The desert is a hostile and inhospitable place, where nature alone reigns. For millennia, man has built an identity out of these places by creating oases, using just what nature was offering. The oasis in the middle of a desert represents a miracle, an unexpected event. The man who travels is aware of the unpredictability of nature, but it also represents an appealing feature that pushes him not to give up. Something coming is always exciting: the desire and the curiosity make the human soul vibrate. As the rose of Jericho, which lives following the rhythm of nature, Unexpected Scenarios highlights the concept of nature – in this case, sun irradiation – deciding for the next event to take place. The project includes two plazas, one made out of desert sand in which three black spheres used for collecting sun energy are set and the other one, surrounded by green, in which a big white sphere will host the events. The interior of the black spheres is covered by mirror panels that concentrate the sun energy on a solar thermal storage that work with a Dual Shell Stirling Engine™ (patented by ADI Solar Corporation) with a capacity between 25 kWh and 100 kWh. This system collects the energy and use it to manage the maintenance of the area and mainly for inflate the bright 40m white sphere, where exhibitions and concerts can be organized. Every day, the energy coming from the sun will give life to a gigantic sculpture, a new landmark for the citizen of Abu Dhabi where to meet and socialize. Unexpected Scenarios does not provide a static object but a daily event sculpture generated by nature. As in life, everyday waits for the next scenarios.
