

I. The creation of this architectural landmark is based on the main action of energy production from solar panels. The middle part of the site is away from bothersome shadings of adjacent buildings

II. A rectangular shape is selected and then extruded to give us a base for the arranging solar panels

III. The box is intersected by the street

IIII. The two main boxes are connected by a bridge which enables people to walk from one side to the other side of the site

IIIII. To sensitize people about the application of solar panels and also to provide an appealing scenario, we have designed two different boxes. This installation holds the variable character of the site
