

Make **SUSTAINABILITY** More **COLORFUL**

The biggest colored solar energy station in the world!

we are looking to put a distinct monument in a distinct citylike Masdar, Because of that we used 3000 m sq of semitransperant coloredsolar energy Panels to supply more than 5000 MW/year. We are looking to give people nice time under shelters as well as supply More as we can of the energyto provide the near buildings.

Solar energy cell panels are not only energy generating parts that we put on High places and roof of buildings away from sight mostly and try to hide them, only To use them to supply energy for us! But it can be a part of architecture and play the main role in the aesthetic values of the architectural form. Because that we tried to present sustainable beauty in our design
