MODULAR COMPONENTS:
- Photovoltaic power generation
- Groundwater desalination
- Landscape leisure construction

1. Expand the basic unit of the equilateral triangle with a side length of 3m. (6m side equilateral triangle and 6m side long hexagon)
2. The center of the triangle is used as the fulcrum to connect the center of the other triangle to the cantilever span, forming a support structure with different heights and curvatures.
3. In theory, the photovoltaic construction on each module covers exactly the functional base of another module (desalting and desalinating water storage or landscape rest entertainment).
4. The relationship between modules through the simple logic to form an ecological root system similar to the mangrove, taking into account the beauty and function.
