

FIJI MAROU

Park of Culture and Technological Innovation

Marou, a privileged island with unparalleled natural beauty, a community on the coast of Naviti Island in the Yasawa archipelago in the western Ba region of Fiji, is reaching out to the world to incorporate a sustainable development project for the surrounding villages and communities. This pilot project incorporates a unique design for sustainable renewable energy in attractive facilities that will usher in a new model of socioeconomic development for the region. This project aims to establish new systems and operating methods for renewable energy and water technologies for island communities as exceptional destinations for cultural development, tourism, biodiversity enhancement, and the scientific community. This project will bring economic benefits through creativity, innovation, and interdisciplinary collaboration, helping to mitigate climate impacts and foster the resilience and adaptation of island communities. To this end, this project is conceived as an inspiration from the ancestral sources of Mother Nature, such as water, wind, and sun—key elements for life, indispensable elements for achieving true transformation in the lives of communities.
