

JUST A ROOF

Local Materials, Open Purpose
The entire structure is built using stacked and bound Fiji bamboo—celebrating local craftsmanship and minimizing environmental impact. The solar panels rest atop this framework, while the bamboo roof is clad with woven bamboo matting to conceal technical installations and incorporate traditional patterns. This layer not only provides cultural texture but also allows for functional integrations like wire concealment and water management. Importantly, no specific program is imposed beneath the roof. It is a gift of space—open, shaded, and ready for whatever the community needs: a market, a performance space, a resting area, or a communal meeting point.
