

Our main vision was formed by palm trees offering shade from the sun. Our project offers a shaded communal space for the locals and tourists alike, meanwhile supporting the solar panels and collecting rainwater. In our project we aim to use bamboo as a locally available building material, which can be familiar to the village's community. This gives the chance to minimize the amount of shipped materials, and to give an opportunity to the locals to shape the final project.

BAMBOO GROVE

ARCHICAD OKTATÁSI VERZIÓ

As mentioned, most of the projects aimed to be possible to build for the community, which involves them in the project from the beginning, and gives them insight into the system, and how it works. This gives the local community the ability to maintain and potentially expand the project, and also to see it more like their creation, opposed to a foreign project.
