

Water Fountain and Energy Hub

During the exhibition, the electricity and distilled water produced by single-unit prototypes will be stored in a small reservoir, from which a miniature fountain landscape will be created, becoming both a visual and conversational focal point.

Playground for Children

The lower reservoir soft bags can serve as an elastic platform, encouraging children's play. This approach aims to soften the cold, mechanical feel of infrastructure while enhancing warmth and interactive participation.

Aqua-Farming

Water from the troughs will be circulated through a pump into outer ponds for aquaculture testing purposes.
