

HEXACHROMA

Each **HEXACHROMA** module produces approximately 10.2 kW of clean electricity. We can install **8 HexaChromas units**, that together can generate **81.6 kW**.

This system can significantly contribute to both clean energy generation and freshwater availability for Marou Village, especially during the dry season.

During the day HEXACHROMA paints colorfull reflections on the floor by the sun, while collecting energy to the village. At night, the artwork will iluminate and serve as a gathering for the coomunity.
