Fly Ranch Vision

Three zones

A Energy & Water
- Production of alternative energy: solar, geothermal
- Water harvesting, storage & purification

B Agriculture & Shelter
- Sustainable production of food: permaculture, orchards, glasshouses, gardens
- Low impact shelters, huts & common spaces

C Recycle & Reuse
- Recycling, composting, waste collection & reuse

Fly Ranch Infrasturctural ecosystem should work as a sustainable, closed loop of energy. All three areas will blend together and contribute to energy that will flow through the site. From the Fly Ranch infrastructure, production and circulation, leading to the major zones that will provide all the necessary components. The proposed project is part of the user segments of the energy loop.

Project Location

The acupuncture of Lagi experimental interventions is located in the middle part of the Fly Ranch site. Zone B, representing the Agriculture & Shelter experimental infrastructure. The exact location of a site is still open for an experimental project in sustainable agriculture. Depending on the final size, quantity & context, it can be located in the Primary Site Boundary or Low-Impact Site Boundary. In the proposed case, in the middle part of the Fly Ranch site.
