THE PRECURSOR.

An installation that is made to purify the air that we breathe, containing contaminants through photosynthesis that is provided by the microalgae. Utilizing the solar energy during the day, and through the night, every structure will be illuminated internally to conserve a better environment for the microorganisms and to continue purifying air 24/7 all year round.

This would change the perception of mankind, combining art with biotechnology, making sustainability a new way of life and therefore creating the beginning of a new era.
