

The Watery

-Water of Life Reimagined

A spiraling catenoid-created sandworm weaves its way through the sands of Fly Ranch, fueled by geothermal and solar power, brewing both potable water and a mini-microclimate. Teeth are made individually of handblown glass, melted sand, underscoring the elemental nature of the mission. Running lights punctuate the surface, and pulse with stored solar energy and evoke the daytime activity of the project, during its nocturnal rest state.
