

VR jellyfish

Most distant site of the new settlement is placed on a previous location of Burning Man (1997). The pavilion is named "Jellyfish". It is a transformable structure, made by metal mesh structure, and pneumo-constructions above, that could be easily modified. The dome space is sufficient for holding massive exhibitions, lectures, as well as experimental venues and forums in VR format. Considering inner space as a special area for virtual space we think about new ways for creating and regenerating interiors without using of any construction materials, thereby reducing construction costs and making "zero"- impact building.
