

The Urban intervention project using micro algae as renewable energy resource

The 53 Hectres of land space in the middle of the city is a prime real estate to encourage for urban farming. **Circular energy production with zero waste.** This is a wonderful opportunity to minimise export and produce for a fraction of the surrounding neighbourhood. The bio waste produced through this process can be used for bio remediation process. The entire project is a proposal for net zero architecture with wonderful landscape.

The idea is to encourage biological/ green renewable energy usage because beauty and efficiency is in nature.
