

MIC in the desert

MIC cube and lamp in a private garden

MIC in front of Mannheim University

MIC furniture in Spinelli park

Step forward

Anywhere for any purpose.

MIC is an attractive solution for communities and individuals, not only in Mannheim, but worldwide. Provided with different clickable panels such as photovoltaic, bio-habitats, algae cultivation systems and whatever new innovations inventors might come up with—MICs do not only look beautiful, but always remind you of an environmentally friendly spirit of time.

In front yards, MICs become an aesthetic statement for renewable energy, while in Spinelli Park, they can provide illuminated pathways at night and much more. MICs can also be used as an autonomous and beautiful energy source in any other endangered place on our planet, that needs environmental protection. It shows how multifaceted and appealing renewable energy can be. It can function as a climate-friendly “Social Cube” in cities or as a smaller version in private gardens in order to generate green and autonomous energy. Especially in cities, the clickable panels offer many different options for vertical greening. With MIC, we take the right step into the future, which is exactly what our planet needs right now.
